ESL 734: Nuclear Energy

Semester II, 2015-2016

$h \lambda \frac{d\lambda}{\lambda} = -d\lambda$

Minor-I Examinations

Marks: 20

Duration: 60 minutes

12 Feb. 2016

1. Find the number of Carbon atoms ($^{12}_6\text{C}$) in 1 cm^3 of graphite with density 1.65 gm/cc . [2]
2. Show that the kinetic energy of the α - particles emitted in an alpha decay is approximately equal to $4Q/A$, where Q is the Q-value of the reaction and A is the mass number of parent nucleus. [4]
3. In a radioactive decay chain $A \rightarrow B \rightarrow C$, if the element C is stable than determine how the amount of C varies with time. Assume $N_A = N_{A0}$ and $N_B = 0$ at $t = 0$. Take λ_A and λ_B as decay constants for element A and B respectively. [5]
4. If a neutron is elastically scattered from a nucleus (Mass number A) at an angle θ , show that the neutron suffers maximum energy loss when is scattered directly backward. [5]
5. A nuclear reactor consuming fissile nuclei ($^{235}_{92}\text{U}$) is operating at a power 0.2 GW with a recoverable energy of 205 MeV . Estimate the burn-up rate of the fissile nuclei. [2]
6. Show that if Compton scattering is the dominant mode of ray interaction, the mass - attenuation coefficient remains roughly the same for all elements. [2]

Given the following constants:

Avagadro's number, $N_A = 0.6022 \times 10^{24} / \text{mol}$
 Boltzmann constant, $k_B = 1.38 \times 10^{-23} \text{ J}^\circ\text{K}$
 Electron charge, $q = 1.602 \times 10^{-19} \text{ C}$
 Electron rest mass, $m_e = 9.109 \times 10^{-31} \text{ kg} = 0.00549 \text{ amu}$
 Proton rest mass, $m_p = 1.672 \times 10^{-27} \text{ kg} = 1.007276 \text{ amu}$
 Neutron rest mass, $m_n = 1.675 \times 10^{-27} \text{ kg} = 1.008665 \text{ amu}$
 Speed of light, $c = 3 \times 10^8 \text{ m/s}$
 $1 \text{ eV} = 1.602 \times 10^{-19} \text{ J}$
 Planck constant, $h = 6.6261 \times 10^{-34} \text{ J-s}$
 Atomic weight of $^{235}_{92}\text{U} = 235.044 \text{ amu}$

$$h\nu_0 e^{-\lambda_0 t} + \frac{\lambda_A N_{A0}}{\lambda_B - \lambda_A} (e^{-\lambda_A t} - e^{-\lambda_B t})$$

$$h\nu = \frac{h\nu_0}{1 + \frac{2 \sin^2 \theta}{2}} = \frac{h\nu_0}{2}$$

$$\frac{[\lambda]}{[A]} = \lambda$$

$$\frac{N E}{A}$$

$$N \cdot M \cdot Z$$

$$N = \frac{m}{M} \cdot N_A$$

$$\frac{N}{A} = \frac{m}{M} \cdot \frac{N_A}{A}$$
