18. [10 points] If Fred is rich, he is happy. But if he's not rich, then he's an unhappy liar. If Fred is either happy or a liar, then he is funny. Fred smells bad when he's funny. Let R denote that Fred is either happy or a liar, then he is funny. Fred smells bad when he's funny. Can you prove that is rich, H happy, L liar, F funny, and S smells bad. Using propositional logic, can you prove that is both rich and smelly? Provide either a proof or a succinct argument explaining why no such proof exists.

To Prove - DR 1S

Consider the negation of the conclusion and stoadd it to the

19. [35 points] Mr. Kashyap heads to a casino for some fun. This casino has two games: Low and and the High bin contains 8 white and 2 dark marbles.

The play for each game proceeds as follows: the dealer draws a single marble uniformly at random from the bin. If a dark marble is drawn, the game pays out. The low payout is \$300 and the high payout is \$3000. The payout is divided evenly among everyone playing that game. For example, if two people are playing Low and a dark marble is drawn, they each receive \$150. If a white marble is drawn, they receive nothing. The drawings for both games are done simultaneously, and only once per night (there is no repeated play).

(a) [2 points] What is Mr Kashyap's expected earnings for each game if he is the only one at the

(b) [3 points] Mr. Kashyap has some unknown utility  $U_h(m)$  for any money m that he makes. If you observe that he chooses to play Low, under what conditions would that be an optimal play? Assume  $U_h(0)=0$ . Show your work.

This means that he are a risk aware player.  $0.5 U_h (300) + 0.5 \times 0 > 0.2 U_h (3000) + 0.5 \times 0$   $\frac{U_h (3000)}{U_h (3000)} < 2.5$ 

Mr. Kashyap is an optimal player under ythe above utility function follows the above megnetity.

(c) Now imagine that Mrs. Kashyap is joining Mr. Kashyap at the casino. First Mr. Kashyap arrives and chooses hers. Let  $m_h$  denote the money and chooses his game. Then Mrs. Kashyap arrives and chooses, since both Mr. and Mrs. earned by Mr. Kashyap and  $m_w$  denote that of Mrs. Kashyap. Moreover, since both Mr. and Mrs. Kashyap are rational agents let us describe their utilities by functions  $V_h(m_h, m_w)$  and  $V_w(m_h, m_w)$ , respectively.

[i] [10 points] Suppose  $V_h(m_h, m_w) = m_h$  and  $V_h(m_h, m_w) = m_w$ , i.e., both players are attempting to maximize their own expected earnings. Compute expected utility for both players, for each combination of games they could play. Show your calculations.

| combination of | games they could | play. Snow your cureum | $E[V_w(m_h,m_w)]$ |
|----------------|------------------|------------------------|-------------------|
| Mr. Kashyap    | Mrs. Kashyap     | $E[V_h(m_h,m_w)]$      | •                 |
| Low            | Low              | (                      |                   |
| Low            | High             |                        |                   |
| High           | Low              |                        |                   |
| High           | High             |                        |                   |

Since Mr. Kashyap chooses first, and Mrs. Kashyap later, what are optimal plays for both of them?

[ii] [6 points] Now rather than maximizing their own individual earnings, Kashyaps have different objectives. Here are five utility functions  $V_h(m_h, m_w)$ :

 $m_h$ 

 $m_h + m_w$ 

 $m_w$ 

 $(m_h+m_w)^2$ 

 $-m_w$ 

and five utility functions  $V_w(m_h, m_w)$ :

mu

mh+mw

- mh

 $2m_w - m_h$ 

log10(mw)

For each of the following scenarios, give the utility function listed above that best encodes the needs of each player. A function may appear multiple times. The first scenario is done for you:

| $V_h(m_h,m_w)$ | $V_{w}(m_{h},m_{w})$ | Scenario   |
|----------------|----------------------|--|
| m <sub>h</sub> | $m_w$                | Both players want to maximize their own expected winnings.   |
|                |                      | Kashyaps have had a terrible fight and are very angry at each other. Each wants the other to lose as much money as possible.   |
|                |                      | Mr. Kashyap has gotten over the fight, and now wants to maximize their expected combined winnings. However, Mrs. Kashyap doesn't trust her husband, that he would give her her due share, so she just wants to maximize her own expected earnings.                                       |
|                |                      | Mr. Kashyap is being extorted by gundas, who will immediately confiscate any money that he wins. Gundas are not monitoring Mrs. Kashyap and do not know about her winnings, so they will not be taken. Both Kashyaps want to maximize the expected total amount the couple gets to keep. |

(d) [7 points] Let us go back to the original problem of part (a) where only Mr. Kashyap is playing. However, now assume that three of the light marbles in each bin are replaced with three multicolored marbles. The rules of the game are the same, except that if the multicolored marble is drawn, it is put back in the bin, all players are asked to pay 20% of the total payoff of the game, and the dealer repeats the process to draw another marble. The game continues until a light or a dark marble is drawn. For example, if Mr. Kashyap is playing Low game, and the dealer draws multicolored, multicolored and then dark, then Mr. Kashyap wins a total of \$180. However, if the last marble is light, he actually loses \$120.

Write down the equations for the expected utility of each game for Mr. Kashyap. Let  $U_h(m) = m$ . Which game should he play (if any)? Show your work.

(e) [7 points] Finally, in the original game of Part (a), Mr. Kashyap decides to play High. However, before the game is started, the dealer makes him an offer to sell each light marble for p each. If Mr. Kashyap decides to buy p light marbles then he will have to pay an upfront cost of p to the dealer, and the game will be played with p0-p10 marbles. This will increase Mr. Kashyap's chances of winning. If Mr. Kashyap decides to buy all light marbles in the bin, what can we say about the price p2. Show your work.
